

# StockSync Sheets — Product Builder Guide

Map columns → preview → create/update WooCommerce products from your sheet.

1

## Choose your Source Sheet

Select which configured sheet to build products from (if multiple builder sheets exist in your setup).

2

## Confirm the Sheet Layout

Verify your header row and column order. If your sheet changed, update mappings before running an import/build.

3

## Map Columns to Product Fields

Map sheet columns to WooCommerce fields (Name, SKU, Prices, Stock Qty, Category, Description, Attributes/Options).

4

## Add Product Images (URL method)

Upload images to WP Media Library, copy the image URL(s), then paste into your sheet image column. Use one URL per product, or multiple URLs separated by your chosen delimiter (commonly comma).

5

## Delimiter & Cleanup Rules

For multi-value fields (categories, tags, attributes, images), set the delimiter (comma, pipe, etc.) and enable trimming/normalization if available.

6

## Preview / Validate

Preview a sample so you can confirm values land in the correct fields. Fix missing required fields (usually Name + SKU).

7

## Choose Create vs Update Behavior

Pick how existing products are matched (normally SKU). Then choose whether to create missing products, update existing products, or both.

8

## Dry Run (if available)

Run Dry Run first to generate a report without writing changes. Switch to Live when the preview/log looks correct.

9

## Run Product Build

Start the build/import. For large sheets, use row ranges/batches if your page offers them for safer processing.

10

## Review Results & Fix Errors

Check the results log for created/updated/skipped rows and any errors (missing SKU, invalid price, image download failures).
